Thus far, there have been developed a great many blind equalization and system identification algorithms, from one-dimensional (1-D) to two-dimensional (2-D) signals, and from single-input single-output (SISO) to multiple-input multiple-output (MIMO) systems. Some of them are closely

## Processing Algorithms

*Blind Equalization and System Identification: Batch*

## Applicatio

Blind System Identification and Equalization. In early 1990's, we investigated blind system identification and equalization. In order to compensate for channel distortion, channel parameters have to be identified explicitly or implicitly. Blind signal processing estimates channel/system parameters only by means of statistics of the system outputs without using any training sequences.

Geoffrey Ye Li Batch

The absence of training signals from many kinds of transmission necessitates the widespread use of blind equalization and system identification. There have been many algorithms developed for these purposes, working with one- or two-dimensional signals and with single-input single-output or..
