Speciation And Genetic Drift Answer

There will always be genetic drift from one generation to the next, but continual, substantial genetic drift results in evolution. The smaller a population is the bigger the impact allele frequency changes have proportionally and this is why evolution often occurs more rapidly in smaller populations.

Speciation And Genetic Drift Answer Key

Speciation is the emergence of new, distinct species during the process of evolution. A single evolutionary lineage splits into two or more lineages by the changes in the genetic material of individuals by mutations, gene flow, genetic drift, and natural selection. Ultimately, the two lineages become incapable of interbreeding with each other.

Difference Between Evolution and Speciation | Definition ...

Genetic drift is change in allele frequencies in a population from generation to generation that occurs due to chance events. To be more exact, genetic drift is change due to "sampling error" in selecting the alleles for the next generation from the gene pool of the current generation.
